| Attributes | Description |
| :---: | :--- |
| val (String Value) | A string representing the name of the font. If the font doesn't exist (because it isn't <br> installed on the system), or the charset not supported by that font, then another font <br> should be substituted. |
| The string length for this attribute shall be 0 to 31 Unicode scalar values. |  |
|  | The possible values for this attribute are defined by the ST_Xstring simple type <br> (§22.9.2.19). |

[Note: The W3C XML Schema definition of this element's content model (CT FontName) is located in §A.2. end note]

### 18.8.30 numFmt (Number Format)

This element specifies number format properties which indicate how to format and render the numeric value of a cell.

Following is a listing of number formats whose formatCode value is implied rather than explicitly saved in the file. In this case, a numFmtId value is written on the xf record, but no corresponding numFmt element is written. Some of these Ids can be interpreted differently, depending on the UI language of the implementing application.
[Note: To maximize interoperability, implementers should restrict the content of this attribute to enumerations present in the lists below. Additional values may be used, but interoperability will only be possible via mutual agreement between implementers. end note]

When values not present in the lists below are used, the behavior is implementation-defined.

Ids not specified in the listing, such as $5,6,7$, and 8 , shall follow the number format specified by the formatCode attribute.

## All Languages

| ID | formatCode |
| :--- | :--- |
| 0 | General |
| 1 | 0 |
| 2 | 0.00 |
| 3 | $\#, \# \# 0$ |
| 4 | $\#, \# \# 0.00$ |
| 9 | $0 \%$ |
| 10 | $0.00 \%$ |

| ID | formatCode |
| :--- | :--- |
| 11 | $0.00 \mathrm{E}+00$ |
| 12 | $\#$ ? ?/? |
| 13 | $\#$ ??/?? |
| 14 | mm-dd-yy |
| 15 | d-mmm-yy |
| 16 | d-mmm |
| 17 | mmm-yy |
| 18 | h:mm AM/PM |
| 19 | h:mm:ss AM/PM |
| 20 | h:mm |
| 21 | h:mm:ss |
| 22 | m/d/yy h:mm |
| 37 | $\#, \# \# 0 ;(\#, \# \# 0)$ |
| 38 | $\# \#, \# \# 0 ;[R e d](\#, \# \# 0)$ |
| 39 | $\#, \# \# 0.00 ;(\#, \# \# 0.00)$ |
| 40 | \#,\#\#0.00;[Red](#,##0.00) |
| 45 | mm:ss |
| 46 | [h]:mm:ss |
| 47 | mmss.0 |
| 48 | $\# \# 0.0 \mathrm{E}+0$ |
| 49 | @ |

## "General" Format

Some additional comments about the "General" number format are appropriate.

The primary goal when a cell is using "General" formatting is to render the cell content without user-specified guidance to the best ability of the application.

## Alignment

(Specified for Left-to-Right mode)

- Strings: left aligned
- Boolean/error values: centered
－Numbers：right aligned
－Dates：do not follow the＂General＂format，instead automatically convert to date formatting．

## Numbers

The application shall attempt to display the full number up to 11 digits（inc．decimal point）．If the number is too large，the application shall attempt to show exponential format．If the number has too many significant digits， the display shall be truncated．The optimal method of display is based on the available cell width．If the number cannot be displayed using any of these formats in the available width，the application shall show＂\＃＂across the width of the cell．

Conditions for switching to exponential format：
1．The cell value shall have at least five digits for $x E-x x$
2．If the exponent is bigger than the size allowed，a floating point number cannot fit，so try exponential notation．
3．Similarly，for negative exponents，check if there is space for even one（non－zero）digit in floating point format．
4．Finally，if there isn＇t room for all of the significant digits in floating point format（for a negative exponent），exponential format shall display more digits if the exponent is less than－3．（The 3 is because E －xx takes 4 characters，and the leading 0 in floating point takes only 1 character．Thus，for an exponent less than -3 ，there is more than 3 additional leading 0 ＇s，more than enough to compensate for the size of the E－xx．）

Floating point rule：
For general formatting in cells，max overall length for cell display is 11 ，not including negative sign，but includes leading zeros and decimal separator．

| Attributes | Description |
| :--- | :--- |
| formatCode <br> (Number Format <br> Code) | The number format code for this number format. <br> The possible values for this attribute are defined by the ST_Xstring simple type <br> (§22.9.2.19). |
| numFmtId <br> (Number Format Id) | Id used by the master style records (xf's) to reference this number format. <br> The possible values for this attribute are defined by the ST_NumFmtId simple type <br> ( $\$ 18.18 .47)$. |

[Note: The W3C XML Schema definition of this element's content model (CT NumFmt) is located in §A.2. end note]

### 18.8.31 numFmts (Number Formats)

This element defines the number formats in this workbook, consisting of a sequence of numFmt records, where each numFmt record defines a particular number format, indicating how to format and render the numeric value of a cell.

## [Example:

This cell is formatting as US currency:

## $\$ 1.23$

The XML expressing this format shows that the formatId is "166" and the decoded formatCode is \$\#, \#\#0.00

```
<numFmts count="1">
    <numFmt numFmtId="166" formatCode="&quot;$&quot;#,##0.00"/>
</numFmts>
```

end example]

## Number Format Codes

Up to four sections of format codes can be specified. The format codes, separated by semicolons, define the formats for positive numbers, negative numbers, zero values, and text, in that order. If only two sections are
specified, the first is used for positive numbers and zeros, and the second is used for negative numbers. If only one section is specified, it is used for all numbers. To skip a section, the ending semicolon for that section shall be written.

The first section, "Format for positive numbers", is the format code that applies to the cell when the cell value contains a positive number.

The second section, "Format for negative numbers", is the format code that applies to the cell when the cell value contains a negative number

The third section, "Format for zeros", is the format code that applies to the cell when the cell value is zero.
The fourth, and last, section, "Format for text", is the format code that applies to the cell when the cell value is text.

The \& (ampersand) text operator is used to join, or concatenate, two values.
The following table describes the different symbols that are available for use in custom number formats.

| Format <br> symbol | Description and result |
| :--- | :--- |
| 0 | Digit placeholder. [Example: If the value 8.9 is to be displayed as 8.90, use the format \#.00 <br> end example] |
| \# | Digit placeholder. This symbol follows the same rules as the 0 symbol. However, the <br> application shall not display extra zeros when the number typed has fewer digits on <br> either side of the decimal than there are \# symbols in the format. [Example: If the custom <br> format is \#.\#\#, and 8.9 is in the cell, the number 8.9 is displayed. end example] |
| ? | Digit placeholder. This symbol follows the same rules as the 0 symbol. However, the <br> application shall put a space for insignificant zeros on either side of the decimal point so <br> that decimal points are aligned in the column. [Example: The custom format 0.0 ? aligns <br> the decimal points for the numbers 8.9 and 88.99 in a column. end example] |
| . (period) | Decimal point. <br> $\%$Percentage. If the cell contains a number between 0 and 1 , and the custom format $0 \%$ is <br> used, the application shall multiply the number by 100 and add the percentage symbol in <br> the cell. |
| , (comma) | Thousands separator. The application shall separate thousands by commas if the format <br> contains a comma that is enclosed by number signs (\#) or by zeros. A comma that follows <br> a placeholder scales the number by one thousand. [Example: If the format is \#.0,, and the <br> cell value is 12,200,000 then the number 12.2 is displayed. end example] |
| E- E+e- e+ | Scientific format. The application shall display a number to the right of the "E" symbol <br> that corresponds to the number of places that the decimal point was moved. [Example: If |

| Format symbol | Description and result |
| :---: | :---: |
|  | the format is $0.00 \mathrm{E}+00$, and the value $12,200,000$ is in the cell, the number $1.22 \mathrm{E}+07$ is displayed. If the number format is $\# 0.0 \mathrm{E}+0$, then the number $12.2 \mathrm{E}+6$ is displayed. end example] |
| \$-+():space | Displays the symbol. If it is desired to display a character that differs from one of these symbols, precede the character with a backslash ( $\backslash$ ). Alternatively, enclose the character in quotation marks. [Example: If the number format is (000), and the value 12 is in the cell, the number (012) is displayed. end example] |
| / | If this symbol is preceded and followed by a number symbol ( $0, \#$, and ?), it is interpreted as the fraction format symbol and will display the number in the format of a fraction. Otherwise, it is interpreted as the forward slash character and is displayed as such. |
| $\backslash$ | Displays the next character in the format. The application shall not display the backslash. [Example: If the number format is $0 \backslash$ !, and the value 3 is in the cell, the value 3 ! is displayed. end example] |
| * | Repeats the next character in the format enough times to fill the column to its current width. There shall not be more than one asterisk in one section of the format. If more than one asterisk appears in one section of the format, all but the last asterisk shall be ignored. [Example: if the number format is $0^{*} x$, and the value 3 is in the cell, the value $3 x x x x x x$ is displayed. The number of $x$ characters that are displayed in the cell varies based on the width of the column. end example] |
| (underline) | Skips the width of the next character. This is useful for lining up negative and positive values in different cells of the same column. [Example: The number format_(0.0_);(0.0) aligns the numbers 2.3 and -4.5 in the column even though the negative number is enclosed by parentheses. end example] |
| "text" | Displays whatever text is inside the quotation marks. [Example: The format 0.00 "dollars" displays 1.23 dollars when the value 1.23 is in the cell. end example] |
| @ | Text placeholder. If text is typed in the cell, the text from the cell is placed in the format where the at symbol (@) appears. [Example: If the number format is "Bob "@" Smith" (including quotation marks), and the value "John" is in the cell, the value Bob John Smith is displayed. end example] |

## Text and spacing

## Display both text and numbers

To display both text and numbers in a cell, enclose the text characters in double quotation marks (" ") or precede a single character with a backslash ( $\backslash$ ). Single quotation marks shall not be used to denote text. Characters inside double quotes, or immediately following backslash shall never be interpreted as part of the format code lexicon; instead they shall always be treated as literal strings. Remember to include the characters in the appropriate section of the format codes. [Example: Use the format $\$ 0.00$ " Surplus"; $\$-0.00$ " Shortage" to display a positive amount as "\$125.74 Surplus" and a negative amount as "\$-125.74 Shortage." end example]

The following characters are displayed without the use of quotation marks.

| $\$$ | Dollar sign |  |  | - | Minus sign |
| :---: | :--- | :--- | :--- | :--- | :--- |
| + | Plus sign |  |  | $/$ | Slash mark |
| ( | Left parenthesis |  |  | $)$ | Right parenthesis |
| $:$ | Colon |  |  | $!$ | Exclamation point |
| $\wedge$ | Circumflex accent (caret) |  |  | $\&$ | Ampersand |
| ' | Apostrophe |  | $\sim$ | Tilde |  |
| $\{$ | Left curly bracket |  |  | $\}$ | Right curly bracket |
| $<$ | Less-than sign |  | $>$ | Greater-than sign |  |
| $=$ | Equal sign |  |  | Space character |  |

Include a section for text entry
If included, a text section shall be the last section in the number format. Include an "at" sign (@) in the section, precisely where the cell's text value should be displayed. If the @ character is omitted from the text section, text typed in the cell will not be displayed. To always display specific text characters with the typed text, enclose the additional text in double quotation marks (" "). [Example: If "June" is typed into the cell, and the text format is "gross receipts for "@ , then the cell will display "gross receipts for June". end example]

If the format does not include a text section, text entered in a cell is not affected by the format code.

## Add spaces

To create a space that is the width of a character in a number format, include an underscore, followed by the character. [Example: When an underscore is followed with a right parenthesis, such as _), positive numbers line up correctly with negative numbers that are enclosed in parentheses because positive numbers are displayed with a blank space after them exactly the width of the right parenthesis character. end example]

## Repeat characters

To repeat the next character in the format to fill the column width, include an asterisk (*) in the number format. [Example: Use 0*- to include enough dashes after a number to fill the cell, or use *0 before any format to include leading zeros. end example]

## Decimal places, spaces, colors, and conditions

## Include decimal places and significant digits

To format fractions or numbers with decimal points, include the following digit placeholders in a section. If a number has more digits to the right of the decimal point than there are placeholders in the format, the number rounds to as many decimal places as there are placeholders. If there are more digits to the left of the decimal point than there are placeholders, the extra digits are displayed. If the format contains only number signs (\#) to the left of the decimal point, numbers less than 1 begin with a decimal point.
\# (number sign) displays only significant digits and does not display insignificant zeros.

0 (zero) displays insignificant zeros if a number has fewer digits than there are zeros in the format.
? (question mark) adds spaces for insignificant zeros on either side of the decimal point so that decimal points align when they are formatted with a fixed-width font, such as Courier New. ? can also be used for fractions that have varying numbers of digits.

| To display | As | Use this code |
| :---: | :---: | :---: |
| 1234.59 | 1234.6 | \#\#\#\#.\# |
| 8.9 | 8.900 | \#. 000 |
| . 631 | 0.6 | 0.\# |
| $\begin{aligned} & 12 \\ & 1234.568 \end{aligned}$ | $\begin{aligned} & 12.0 \\ & 1234.57 \end{aligned}$ | \#.0\# |
| $\begin{aligned} & 44.398 \\ & 102.65 \\ & 2.8 \end{aligned}$ | $\begin{aligned} & 44.398 \\ & 102.65 \\ & 2.8 \\ & \text { (with aligned decimals) } \end{aligned}$ | ???.??? |
| $\begin{aligned} & 5.25 \\ & 5.3 \end{aligned}$ | $\begin{aligned} & 51 / 4 \\ & 53 / 10 \\ & \text { (with aligned fractions) } \end{aligned}$ | \# ???/??? |

## Display a thousands separator

To display a comma as a thousands separator or to scale a number by a multiple of 1,000 , include a comma in the number format.

| To display | As | Use this code |
| :--- | :--- | :--- |
| 12000 | 12,000 | $\#, \# \# \#$ |
| 12000 | 12 | $\#$, |
| 12200000 | 12.2 | $0.0,$, |

## Specify colors

To set the text color for a section of the format, use the name of one of the following eight colors in square brackets in the section. The color code shall be the first item in the section.

| [Black] |  | [Blue] |  | [Cyan] |
| :--- | :--- | :--- | :--- | :--- |
| [Green] |  | [Magenta] |  | $[$ Red $]$ |
| [White $]$ |  | [Yellow] |  |  |

Instead of using the name of the color, the color index can be used, like this [Color3] for Red. Numeric indexes for color are restircted to the range from 1 to 56 , which reference by index to the legacy color palette.
[Note: the default legacy color palette values are listed in §18.8.27. In the format codes, [Color1] refers to the color associated with indexed="8", or black (by default), [Color2] refers to the color associated with indexed="9", or white (by default), and so on up to [Color56] referring to the color associated with indexed="63". If the color palette has been customized from default values, then the colors associated with these indexes will reflect those customizations.

## Specify conditions

To set number formats that are applied only if a number meets a specified condition, enclose the condition in square brackets. The condition consists of a comparison operator and a value. Comparison operators include: = Equal to; > Greater than; < Less than; >= Greater than or equal to, <= Less than or equal to, and <> Not equal to. [Example: The following format displays numbers that are less than or equal to 100 in a red font and numbers that are greater than 100 in a blue font.

```
[Red][<=100];[Blue][>100]
```

## end example]

If the cell value does not meet any of the criteria, then pound signs ("\#") are displayed across the width of the cell.

## Currency, percentages, and scientific notation

## Include currency symbols

To include currency symbols, place the currency symbol in the location it should when displayed.

## Display percentages

To display numbers as a percentage of 100 - [Example: To display .08 as $8 \%$ or 2.8 as $280 \%$ end example]include the percent sign (\%) in the number format.

## Display scientific notations

To display numbers in scientific format, use exponent codes in a section - [Example: E-, E+, e-, or e+. end example]

If a format contains a zero (0) or number sign (\#) to the right of an exponent code, the application displays the number in scientific format and inserts an "E" or "e". The number of zeros or number signs to the right of a code determines the number of digits in the exponent. "E-" or "e-" places a minus sign by negative exponents. "E+" or "e+" places a minus sign by negative exponents and a plus sign by positive exponents.

## Dates and times

Display days, months, and years

| To display As | Use this code |  |
| :--- | :--- | :--- |
| Months | $1-12$ | m |
| Months | $01-12$ | mm |
| Months | Jan-Dec | mmm |
| Months | January-December | mmmm |
| Months | J-D | mmmmm |
| Days | 1-31 | dd |
| Days | 01-31 | ddd |
| Days | Sun-Sat | dddd |
| Days | Sunday-Saturday | yy |
| Years | 00-99 | date-base minimum value -9999 yyyy |
| Years |  |  |

See §18.17.4.1 for details on possible date systems.

## Month versus minutes

If "m" or "mm" code is used immediately after the "h" or "hh" code (for hours) or immediately before the "ss" code (for seconds), the application shall display minutes instead of the month.

Display hours, minutes, and seconds

| To display | As | Use this code |
| :--- | :--- | :--- |
| Hours | $0-23$ | h |
| Hours | $00-23$ | hh |

| Minutes | $0-59$ | m |
| :--- | :--- | :--- |
| Minutes | $00-59$ | mm |
| Seconds | $0-59$ | s |
| Seconds | $00-59$ | ss |
| Time | 4 AM | $\mathrm{h} \mathrm{AM/PM}$ |
| Time | $4: 36$ PM | $\mathrm{h:mm} \mathrm{AM/PM}$ |
| Time | $4: 36: 03 \mathrm{P}$ | $\mathrm{h}: \mathrm{mm}: \mathrm{ss} \mathrm{A/P}$ |
| Time | $4: 36: 03.75$ | $\mathrm{~h}: \mathrm{mm}: \mathrm{ss} .00$ |
| Elapsed time (hours and minutes) | $1: 02$ | [h]:mm |
| Elapsed time (minutes and seconds) | $62: 16$ | [mm]:ss |
| Elapsed time (seconds and hundredths) | 3735.80 | [ss].00 |

## Minutes versus month

The " $m$ " or " $m m$ " code shall appear immediately after the " h " or " hh " code or immediately before the "ss" code; otherwise, these will display as the month instead of minutes.

## $A M$ and $P M$

If the format contains AM or PM, the hour is based on the 12-hour clock, where "AM" or "A" indicates times from midnight until noon and "PM" or "P" indicates times from noon until midnight. Otherwise, the hour is based on the 24 -hour clock.

## Illegal date and time values

Cells formatted with a date or time format and which contain date or time values which do not meet the requirements specified shall show the pound sign ("\#") across the width of the cell.

## International Considerations

| Format Code |  |
| :--- | :--- |
| $r$ | ja-jp/zh-tw only. |

| Format Code | Description |
| :---: | :---: |
|  | When loading in ja-jp locale, code becomes "ee". <br> When loading in zh-tw locale, code becomes "e". |
| rr | ja-jp/zh-tw only. <br> When loading in ja-jp locale, code becomes "gggee". <br> When loading in zh-tw locale, code becomes "e". |
| g | When loading in ja-jp locale: Single Roman character emperor reign <br> When loading in zh-tw (Taiwan only) locale: treat same as "gg". |
| gg | When loading in ja-jp locale: Single Kanji character emperor reign <br> When loading in zh-tw locale: Last era short name (since 1911) |
| ggg | When loading in ja-jp locale: Tow Kanji character emperor reign <br> When loading in zh-tw locale: Last era long name (since 1911) |
| e | When loading in ja-jp locale: Era year <br> When lading in zh-tw (Taiwan only) locale: Era year since 1912. If preceded by " g ", "gg", or "ggg" then year of 1912, and years before 1912 are special, otherwise years before 1912 are Gregorian. <br> OTHER locales: becomes "yyyy" |
| ee | When loading in ja-jp locale: Era year w/ leading zero <br> When loading in zh-tw (Taiwan only) locale: Era year since 1911 <br> OTHER locales: becomes "yy" |
| b2 | Hijri calander |
| b1 | Gregorian calendar |
| [\$USD-409] | Specifies currency and locale/date system/number system information. <br> Syntax is [ $\$<$ Currency String>-<language info>]. Currency string is a string to use as a currency symbol. Language info is a 32 -bit value entered in hexidecimal format. <br> Language info format (byte 3 is most significant byte): <br> Bytes 0,1: 16 -bit Language ID (LID). <br> Byte 2: Calendar type. High bit indicates that input is parsed using specified calendar. <br> Byte 3: Number system type. High bit indicates that input is parsed using specified number system. <br> Special language info values: |

| Format Code |  | Description |
| :--- | :--- | :--- |
|  | 0xf800: System long date format <br> 0xf400: System time format |  |

| Attributes | Description |
| :--- | :--- |
| count (Number <br> Format Count) | Count of number format elements. <br> The possible values for this attribute are defined by the W3C XML Schema unsignedInt <br> datatype. |

[Note: The W3C XML Schema definition of this element's content model (CT NumFmts) is located in §A.2. end note]

### 18.8.32 patternFill (Pattern)

This element is used to specify cell fill information for pattern and solid color cell fills. For solid cell fills (no pattern), fgColor is used. For cell fills with patterns specified, then the cell fill color is specified by the bgColor element.

| Attributes | Description |
| :--- | :--- |
| patternType <br> (Pattern Type) | Specifies the fill pattern type (including solid and none) Default is none, when missing. <br> The possible values for this attribute are defined by the ST_PatternType simple type <br> (§18.18.55). |

[Note: The W3C XML Schema definition of this element's content model (CT PatternFill) is located in §A.2. end note]

### 18.8.33 protection (Protection Properties)

Contains protection properties associated with the cell. Each cell has protection properties that can be set. The cell protection properties do not take effect unless the sheet has been protected.

| Attributes | Description |
| :--- | :--- |
| hidden (Hidden <br> Cell) | A boolean value indicating if the cell is hidden. When the cell is hidden and the sheet on <br> which the cell resides is protected, then the cell value is displayed in the cell grid location, <br> but the contents of the cell will not be displayed in the formula bar. This is true for all <br> types of cell content, including formula, text, or numbers. <br> Therefore the cell A4 can contain a formula "=SUM(A1:A3)", but if the cell protection <br> property of A4 is marked as hidden, and the sheet is protected, then the cell should <br> display the calculated result [Example: "6" end example], but will not display the formula |
